

AGNI-NETRA

AI Geospatial Network for Industrial Thermal Risk & Anomaly Analysis

INTELLIGENCE DOSSIER • Generated on 2026-09-11 15:05 UTC • DECISION SUPPORT SYSTEM

Event Code: EVT-TEST-343664	Classification: Gas Flare (92.0%)
Location: 22.47000°N, 69.83000°E (Gujarat)	AGNI-NETRA Risk Level: CRITICAL (78.5/100)
Active Detections: 3 observations	Peak Radiative Power (FRP): 150.0 MW
First Detected: 2026-09-06 00:02:25	Last Detected: 2026-09-06 00:02:25

1. Explainable AI (SHAP) Attribution

Evaluated via candidate XGBoost v3.0 model with TreeExplainer SHAP attribution.

Feature Name	Value	Shapley Impact	Direction
dist_to_facility_m	500.0	+0.420	Supports Class (+)

2. Geospatial Facility Association

Associated Facility: None (Uncataloged Site)	Facility Type: N/A
Facility Status: UNKNOWN	Distance to Boundary: 500.0 m
Land Cover Context: Industrial	Source Provenance: OSM / Satellite Survey

3. Risk Evaluation & Drivers

- Elevated thermal intensity in industrial corridor.

4. Model Governance & Data Provenance

Model Version: XGBoost V3 (xgb-v3.0-real-candidate • Platt-Calibrated)	Telemetry Source: NASA FIRMS S-NPP/VIIRS 375m NRT
Spatial Context Engine: PostGIS 3.4 Multi-Layer Topology	Verification Status: ACTIVE (Pending Human Verification)
Automated Dispatch: DISABLED / GATED SAFE (Human Decision Support)	Dossier Generated: 2026-09-11 15:05:05 UTC
